This application claims the benefit of U.S. Provisional
5 Application No. 60/456,691 filed March 21, 2003, which is
hereby incorporated by reference.

FIELD OF THE INVENTION

10 This invention is in the field of pharmaceutical
agents and specifically relates to compounds, compositions,
uses and methods for treating cancer and angiogenesis-
related disorders.

BACKGROUND OF THE INVENTION

Protein kinases represent a large family of proteins
which play a central role in the regulation of a wide
variety of cellular processes, maintaining control over
20 cellular function. A partial list of such kinases includes
abl, Akt, bcr-abl, Blk, Brk, Btk, c-kit, c-met, c-src,
c-fms, CDK1, CDK2, CDK3, CDK4, CDK5, CDK6, CDK7, CDK8,
CDK9, CDK10, cRaf1, CSF1R, CSK, EGFR, ErbB2, ErbB3, ErbB4,
Erk, Fak, fes, FGFR1, FGFR2, FGFR3, FGFR4, FGFR5, Fgr, flt-
25 1, Fps, Frk, Fyn, Hck, IGF-1R, INS-R, Jak, KDR, Lck, Lyn,
MEK, p38, PDGFR, PIK, PKC, PYK2, ros, tie, tie2, TRK, Yes,
and Zap70. Inhibition of such kinases has become an
important therapeutic target.

Certain diseases are known to be associated with
30 deregulated angiogenesis, for example ocular
neovascularisation, such as retinopathies (including
diabetic retinopathy), age-related macular degeneration,
psoriasis, hemangioblastoma, hemangioma, arteriosclerosis,
inflammatory disease, such as a rheumatoid or rheumatic
35 inflammatory disease, especially arthritis (including
rheumatoid arthritis), or other chronic inflammatory
disorders, such as chronic asthma, arterial or post-

transplantational atherosclerosis, endometriosis, and neoplastic diseases, for example so-called solid tumors and liquid tumors (such as leukemias).

At the center of the network regulating the growth and differentiation of the vascular system and its components, both during embryonic development and normal growth, and in a wide number of pathological anomalies and diseases, lies the angiogenic factor known as Vascular Endothelial Growth Factor" (VEGF; originally termed 'Vascular Permeability Factor", VPF), along with its cellular receptors (see G. Breier et al., Trends in Cell Biology, 6:454-456 (1996)).

VEGF is a dimeric, disulfide-linked 46-kDa glycoprotein related to "Platelet-Derived Growth Factor" (PDGF); it is produced by normal cell lines and tumor cell lines; is an endothelial cell-specific mitogen; shows angiogenic activity in *in vivo* test systems (e.g. rabbit cornea); is chemotactic for endothelial cells and monocytes; and induces plasminogen activators in endothelial cells, which are involved in the proteolytic degradation of extracellular matrix during the formation of capillaries. A number of isoforms of VEGF are known, which show comparable biological activity, but differ in the type of cells that secrete them and in their heparin-binding capacity. In addition, there are other members of the VEGF family, such as "Placenta Growth Factor" (PlGF) and VEGF-C.

VEGF receptors (VEGFR) are transmembranous receptor tyrosine kinases. They are characterized by an extracellular domain with seven immunoglobulin-like domains and an intracellular tyrosine kinase domain. Various types of VEGF receptor are known, e.g. VEGFR-1 (also known as flt-1), VEGFR-2 (also known as KDR), and VEGFR-3.

A large number of human tumors, especially gliomas and carcinomas, express high levels of VEGF and its receptors. This has led to the hypothesis that the VEGF released by

tumor cells stimulates the growth of blood capillaries and the proliferation of tumor endothelium in a paracrine manner and through the improved blood supply, accelerate tumor growth. Increased VEGF expression could explain the

5 occurrence of cerebral edema in patients with glioma.

Direct evidence of the role of VEGF as a tumor angiogenesis factor *in vivo* is shown in studies in which VEGF expression or VEGF activity was inhibited. This was achieved with anti-VEGF antibodies, with dominant-negative VEGFR-2 mutants
10 which inhibited signal transduction, and with antisense-VEGF RNA techniques. All approaches led to a reduction in the growth of glioma cell lines or other tumor cell lines *in vivo* as a result of inhibited tumor angiogenesis.

Angiogenesis is regarded as an absolute prerequisite
15 for tumors which grow beyond a diameter of about 1-2 mm; up to this limit, oxygen and nutrients may be supplied to the tumor cells by diffusion. Every tumor, regardless of its origin and its cause, is thus dependent on angiogenesis for its growth after it has reached a certain size.

20 Three principal mechanisms play an important part in the activity of angiogenesis inhibitors against tumors:

1) Inhibition of the growth of vessels, especially capillaries, into avascular resting tumors, with the result that there is no net tumor growth owing to the balance that

25 is achieved between cell death and proliferation; 2)

Prevention of the migration of tumor cells owing to the absence of blood flow to and from tumors; and 3) Inhibition of endothelial cell proliferation, thus avoiding the paracrine growth-stimulating effect exerted on the

30 surrounding tissue by the endothelial cells which normally line the vessels. See R. Connell and J. Beebe, Exp. Opin. Ther. Patents, 11:77-114 (2001).

VEGF's are unique in that they are the only angiogenic growth factors known to contribute to vascular

hyperpermeability and the formation of edema. Indeed, vascular hyperpermeability and edema that is associated with the expression or administration of many other growth factors appears to be mediated via VEGF production.

5 Inflammatory cytokines stimulate VEGF production. Hypoxia results in a marked upregulation of VEGF in numerous tissues, hence situations involving infarct, occlusion, ischemia, anemia, or circulatory impairment typically invoke VEGF/VPF-mediated responses. Vascular hyperpermeability,
10 associated edema, altered transendothelial exchange and macromolecular extravasation, which is often accompanied by diapedesis, can result in excessive matrix deposition, aberrant stromal proliferation, fibrosis, etc. Hence, VEGF-mediated hyperpermeability can significantly contribute to
15 disorders with these etiologic features. As such, regulators of angiogenesis have become an important therapeutic target.

Compounds of the current invention have not been described as inhibitors of angiogenesis such as for the
20 treatment of cancer.

COMBINATIONS

While the compounds of the invention can be

20 administered as the sole active pharmaceutical agent, they can also be used in combination with one or more compounds of the invention or other agents. When administered as a combination, the therapeutic agents can be formulated as separate compositions that are administered at the same

25 time or sequentially at different times, or the therapeutic agents can be given as a single composition.

The phrase "co-therapy" (or "combination-therapy"), in defining use of a compound of the present invention and another pharmaceutical agent, is intended to embrace

30 administration of each agent in a sequential manner in a regimen that will provide beneficial effects of the drug combination, and is intended as well to embrace co-administration of these agents in a substantially simultaneous manner, such as in a single capsule having a

fixed ratio of these active agents or in multiple, separate capsules for each agent.

Specifically, the administration of compounds of the present invention may be in conjunction with additional
5 therapies known to those skilled in the art in the prevention or treatment of neoplasia, such as with radiation therapy or with cytostatic or cytotoxic agents.

If formulated as a fixed dose, such combination products employ the compounds of this invention within the
10 accepted dosage ranges. Compounds of Formula I may also be administered sequentially with known anticancer or cytotoxic agents when a combination formulation is inappropriate. The invention is not limited in the sequence of administration; compounds of the invention may be administered either prior
15 to, simultaneous with or after administration of the known anticancer or cytotoxic agent.

Currently, standard treatment of primary tumors consists of surgical excision followed by either radiation or IV administered chemotherapy. The typical chemotherapy
20 regime consists of either DNA alkylating agents, DNA intercalating agents, CDK inhibitors, or microtubule poisons. The chemotherapy doses used are just below the maximal tolerated dose and therefore dose limiting toxicities typically include, nausea, vomiting, diarrhea,
25 hair loss, neutropenia and the like.

There are large numbers of antineoplastic agents available in commercial use, in clinical evaluation and in pre-clinical development, which would be selected for treatment of neoplasia by combination drug chemotherapy.

The present invention comprises processes for the preparation of a compound of Formula I-III.
Also included in the family of compounds of Formula I-III are the pharmaceutically-acceptable salts thereof. The term
25 "pharmaceutically-acceptable salts" embraces salts commonly used to form alkali metal salts and to form addition salts of free acids or free bases. The nature of the salt is not critical, provided that it is pharmaceutically-acceptable. Suitable pharmaceutically-acceptable acid addition salts of
30 compounds of Formula I-III may be prepared from an inorganic acid or from an organic acid. Examples of such inorganic acids are hydrochloric, hydrobromic, hydroiodic, nitric, carbonic, sulfuric and phosphoric acid. Appropriate organic acids may be selected from aliphatic, cycloaliphatic,

aromatic, arylaliphatic, heterocyclic, carboxylic and sulfonic classes of organic acids, example of which are formic, acetic, adipic, butyric, propionic, succinic, glycolic, gluconic, lactic, malic, tartaric, citric, ascorbic, glucuronic, maleic, fumaric, pyruvic, aspartic, glutamic, benzoic, anthranilic, mesylic, 4-hydroxybenzoic, phenylacetic, mandelic, embonic (pamoic), methanesulfonic, ethanesulfonic, ethanedisulfonic, benzenesulfonic, pantothenic, 2-hydroxyethanesulfonic, toluenesulfonic, sulfanilic, cyclohexylaminosulfonic, camphoric, camphorsulfonic, digluconic, cyclopentanepropionic, dodecylsulfonic, glucoheptanoic, glycerophosphonic, heptanoic, hexanoic, nicotinic, 2-hydroxy-ethanesulfonic, 2-naphthalenesulfonic, oxalic, palmoic, pectinic, persulfuric, 2-phenylpropionic, picric, pivalic propionic, succinic, tartaric, thiocyanic, mesylic, undecanoic, stearic, algenic, β -hydroxybutyric, salicylic, galactaric and galacturonic acid. Suitable pharmaceutically-acceptable base addition salts of compounds of Formula I-III include metallic salts, such as salts made from aluminum, calcium, lithium, magnesium, potassium, sodium and zinc, or salts made from organic bases including primary, secondary and tertiary amines, substituted amines including cyclic amines, such as caffeine, arginine, diethylamine, N-ethyl piperidine, histidine, glucamine, isopropylamine, lysine, morpholine, N-ethyl morpholine, piperazine, piperidine, triethylamine, trimethylamine. All of these salts may be prepared by conventional means from the corresponding compound of the invention by reacting, for example, the appropriate acid or base with the compound of Formula I-III.

Also, the basic nitrogen-containing groups can be quaternized with such agents as lower alkyl halides, such as methyl, ethyl, propyl, and butyl chloride, bromides and iodides; dialkyl sulfates like dimethyl, diethyl, dibutyl,

and diamyl sulfates, long chain halides such as decyl, lauryl, myristyl and stearyl chlorides, bromides and iodides, aralkyl halides like benzyl and phenethyl bromides, and others. Water or oil-soluble or dispersible products are thereby obtained.

Examples of acids that may be employed to form pharmaceutically acceptable acid addition salts include such inorganic acids as hydrochloric acid, sulphuric acid and phosphoric acid and such organic acids as oxalic acid, maleic acid, succinic acid and citric acid. Other examples include salts with alkali metals or alkaline earth metals, such as sodium, potassium, calcium or magnesium or with organic bases. Preferred salts include hydrochloride, phosphate and edisylate.

Additional examples of such salts can be found in Berge et al., J. Pharm. Sci., 66:1 (1977).

Scheme 1

20

Substituted benzimidazoles can be prepared by the process outlined in Scheme 1. An benzimidazol-2-one can be prepared by the method described in J. Het., 2561 (1999) from the diamine **1**. Treatment with POCl₃ provides the 2-chloro compound **2**, which can be substituted with a variety

of compounds to form the benzimidazoles **3** of the present invention.

Scheme 2

Alternatively, substituted benzimidazoles **3** (where W is NH) can be prepared by the process outlined in Scheme 2. Diamine **1** is reacted with a substituted isothiocyanate **4**, in an appropriate solvent such as CH₃CN, at a temperature of about RT. Addition of an amine coupling reagent, such as EDC, at a temperature above about 50 °C, and preferably at about 80 °C, forms the benzimidazoles **3**.

Scheme 3

20 Substituted amines can be prepared by the process outlined in Scheme 3. Substituted amines **6** can be prepared similar to that described in WO 03/006438. Reduction of the nitro substituted compound **6**, such as with Pd/C and hydrogen, in the presence of an alcohol, such as EtOH, at a temperature about RT, provides the diamine **1**.

25

Scheme 4

5 Substituted benzoxazoles can be prepared by the process outlined in Scheme 4. 1-Amino-2-hydroxy aromatic compounds **7** are reacted with a substituted isothiocyanate **4**, in an appropriate solvent such as CH_3CN , at a temperature of about RT. Addition of an amine coupling reagent, such as

10 EDC, at a temperature above about 50°C , and preferably at about 80°C , forms the benzoxazoles **8**.

Scheme 5

Azaindole phenol ethers can be prepared by the process outlined in Scheme 5. Halo substituted azaindoles **9** can be coupled with phenols and the like **10**, such as in the presence of TFA:Et₃N, at a temperature above about 50 °C, preferably above about 100 °C, and more preferably at about 150 °C, to form the protected ether **11**. Removal of any protecting groups, such as by hydrogenation in the presence of a catalyst, such as Pd/C, and nitration, such as with HNO₃ in the presence of AcOH, provides the nitrophenols **13**. Reduction of the nitro substituted compound **13**, such as with hydrogenation in the presence of a catalyst, such as Pd/C, provides the amino substituted azaindole phenol ethers **14**.

Scheme 6

Substituted benzothiazoles can be prepared by the process outlined in Scheme 6. 2-Amino-5-hydroxy benzothiazoles **16** are reacted with a halo compound **15** to form the 2-amino-benzothiazole ether **17**. Further substitution such as with substituted halides yields the disubstituted benzothiazole **18**. Alternatively, substituted isothiocyanate **4** are reacted with 1-amino-2-thio compounds **19** in an appropriate solvent such as CH₃CN, at a temperature

of about RT. Addition of an amine coupling reagent, such as EDC, at a temperature above about 50 °C, and preferably at about 80 °C, forms the benzothiazoles **18**.

Scheme 7

Alternatively substituted benzothiazoles can be prepared by the process outlined in Scheme 7. Substituted isothiocyanate are reacted with 1-amino-2-thio compounds **20** in an appropriate solvent such as CH₃CN, at a temperature of about RT. Addition of an amine coupling reagent, such as EDC, at a temperature above about 50 °C, and preferably at about 80 °C, forms the benzothiazoles **21**. The 5-hydroxy benzothiazole **21** is reacted with a halo compound to form the 2-amino-benzothiazole ether **18**.

Scheme 8

20

3,4-Diaminophenyl ethers **25** are prepared by the method described in Scheme 8. 3,4-Dinitrophenyl ethers **24** are formed by coupling alcohols **22** with 1-fluoro-3,4-dinitrobenzenes **23**, in an appropriate solvent such as anhydrous DMF, and in the presence of base, such as K₂CO₃, and at a temperature above about 50 °C, preferably above

about 100 °C, more preferably at about 120 °C. Reduction of the nitro substituted compound **24**, such as with hydrogenation in the presence of an alcohol, such as MeOH, in the presence of a catalyst, such as Pd/C, provides the diamine **25**. Reduction by Zn, in the presence of acid, such as HOAc also produces the di-amine. Alternatively, alcohol **22** can be coupled with 4-chloro-2-nitroanilines to form the nitroaniline ethers, which can be reacted as described above to form the 3,4-diaminophenyl ethers **25**.

Scheme 9

15

2-Hydroxyanilines **29** are prepared by the method described in Scheme 9. Protected phenols **26** (where PG is a protecting group) are deprotected then nitrated to form the nitrophenols **28**. The nitrophenols **28** are reduced to form the anilines **29**.

20

Scheme 10

25

3,4-Dinitrophenyl ethers **24** are prepared by the method described in Scheme 10. 3,4-Dinitrophenyl ethers **24** are formed by coupling compounds **30** where L is a leaving group

such as halo, preferably chloro, with 3,4-dinitrophenols **31**, at a temperature above about 50 °C, preferably above about 100 °C, more preferably at about 150 °C.

The starting compounds defined in Schemes 1-10 may also be present with functional groups in protected form if necessary and/or in the form of salts, provided a salt-forming group is present and the reaction in salt form is possible. If so desired, one compound of Formula I can be converted into another compound of Formula I or a N-oxide thereof; a compound of Formula I can be converted into a salt; a salt of a compound of Formula I can be converted into the free compound or another salt; and/or a mixture of isomeric compounds of Formula I can be separated into the individual isomers.

N-Oxides can be obtained in a known manner by reacting a compound of formula I with hydrogen peroxide, oxone, or a peracid, e.g. 3-chloroperoxy-benzoic acid, in an inert solvent, e.g. dichloromethane, or a mixture of water and an alcohol such as MeOH or EtOH, at a temperature between about -10-35 °C, such as about 0 °C - RT.

If one or more other functional groups, for example carboxy, hydroxy, amino, or mercapto, are or need to be protected in a compound of Formula I or in the preparation of compounds of Formula I, because they should not take part in the reaction, these are such groups as are usually used in the synthesis of peptide compounds, and also of cephalosporins and penicillins, as well as nucleic acid derivatives and sugars.

The protecting groups may already be present in precursors and should protect the functional groups concerned against unwanted secondary reactions, such as acylations, etherifications, esterifications, oxidations, solvolysis, and similar reactions. It is a characteristic of protecting groups that they lend themselves readily, i.e.

without undesired secondary reactions, to removal, typically by solvolysis, reduction, photolysis or also by enzyme activity, for example under conditions analogous to physiological conditions, and that they are not present in the end-products. The specialist knows, or can easily establish, which protecting groups are suitable with the reactions mentioned above and hereinafter.

The protection of such functional groups by such protecting groups, the protecting groups themselves, and their removal reactions are described for example in standard reference works, such as J.F.W. McOmie, "Protective Groups in Organic Chemistry", Plenum Press, London and New York (1973), in T.W. Greene, "Protective Groups in Organic Synthesis", Wiley, New York (1981), in "The Peptides", Volume 3 (editors: E. Gross and J. Meienhofer), Academic Press, London and New York (1981), in "Methoden der Organischen Chemie" (Methods of Organic Chemistry), Houben Weyl, 4th edition, Volume 15/1, Georg Thieme Verlag, Stuttgart (1974), in H.-D. Jakubke and H. Jescheit, "Aminosäuren, Peptide, Proteine" (Amino Acids, Peptides, Proteins), Verlag Chemie, Weinheim, Deerfield Beach, and Basel (1982), and in Jochen Lehmann, "Chemie der Kohlenhydrate: Monosaccharide und Derivate" (Chemistry of Carbohydrates: Monosaccharides and Derivatives), Georg Thieme Verlag, Stuttgart (1974).

In the additional process steps, carried out as desired, functional groups of the starting compounds which should not take part in the reaction may be present in unprotected form or may be protected for example by one or more of the protecting groups mentioned above under "protecting groups". The protecting groups are then wholly or partly removed according to one of the methods described there.

Salts of a compound of Formula I with a salt-forming group may be prepared in a manner known *per se*. Acid addition salts of compounds of Formula I may thus be obtained by treatment with an acid or with a suitable anion exchange reagent. A salt with two acid molecules (for example a dihalogenide of a compound of Formula I) may also be converted into a salt with one acid molecule per compound (for example a monohalogenide); this may be done by heating to a melt, or for example by heating as a solid under a high vacuum at elevated temperature, for example from 130 to 170 °C, one molecule of the acid being expelled per molecule of a compound of Formula I.

Salts can usually be converted to free compounds, e.g. by treating with suitable basic agents, for example with alkali metal carbonates, alkali metal hydrogen carbonates, or alkali metal hydroxides, typically potassium carbonate or sodium hydroxide.

All process steps described here can be carried out under known reaction conditions, preferably under those specifically mentioned, in the absence of or usually in the presence of solvents or diluents, preferably such as are inert to the reagents used and able to dissolve these, in the absence or presence of catalysts, condensing agents or neutralizing agents, for example ion exchangers, typically cation exchangers, for example in the H⁺ form, depending on the type of reaction and/or reactants at reduced, normal, or elevated temperature, for example in the range from about -100 °C to about 190 °C, preferably from about -80 °C to about 150 °C, for example at about -80 to about 60 °C, at RT, at about -20 to about 40 °C or at the boiling point of the solvent used, under atmospheric pressure or in a closed vessel, where appropriate under pressure, and/or in an inert atmosphere, for example under argon or nitrogen.

Salts may be present in all starting compounds and transients, if these contain salt-forming groups. Salts may also be present during the reaction of such compounds, provided the reaction is not thereby disturbed.

5 In certain cases, typically in hydrogenation processes, it is possible to achieve stereoselective reactions, allowing for example easier recovery of individual isomers.

10 The solvents from which those can be selected which are suitable for the reaction in question include for example water, esters, typically lower alkyl-lower alkanooates, e.g., EtOAc, ethers, typically aliphatic ethers, e.g., Et₂O, or cyclic ethers, e.g., THF, liquid aromatic hydrocarbons, typically benzene or iPrOH toluene, alcohols, 15 typically MeOH, EtOH or 1-propanol, nitriles, typically CH₃CN, halogenated hydrocarbons, typically CH₂Cl₂, acid amides, typically DMF, bases, typically heterocyclic nitrogen bases, e.g. pyridine, carboxylic acids, typically lower alkanecarboxylic acids, e.g., AcOH, carboxylic acid 20 anhydrides, typically lower alkane acid anhydrides, e.g., acetic anhydride, cyclic, linear, or branched hydrocarbons, typically cyclohexane, hexane, or isopentane, or mixtures of these solvents, e.g., aqueous solutions, unless otherwise stated in the description of the process. Such solvent 25 mixtures may also be used in processing, for example in chromatography.

30 The invention relates also to those forms of the process in which one starts from a compound obtainable at any stage as a transient and carries out the missing steps, or breaks off the process at any stage, or forms a starting material under the reaction conditions, or uses said starting material in the form of a reactive derivative or salt, or produces a compound obtainable by means of the process according to the invention and processes the said

compound *in situ*. In the preferred embodiment, one starts from those starting materials which lead to the compounds described above as preferred.

5 The compounds of Formula I, including their salts, are also obtainable in the form of hydrates, or their crystals can include for example the solvent used for crystallization (present as solvates).

10 New starting materials and/or intermediates, as well as processes for the preparation thereof, are likewise the subject of this invention. In the preferred embodiment, such starting materials are used and reaction conditions so selected as to enable the preferred compounds to be obtained.

15 Starting materials of the invention, are known, are commercially available, or can be synthesized in analogy to or according to methods that are known in the art.

20 In the preparation of starting materials, existing functional groups which do not participate in the reaction should, if necessary, be protected. Preferred protecting groups, their introduction and their removal are described above or in the examples.

25 All remaining starting materials are known, capable of being prepared according to known processes, or commercially obtainable; in particular, they can be prepared using processes as described in the examples.

30 Compounds of the present invention can possess, in general, one or more asymmetric carbon atoms and are thus capable of existing in the form of optical isomers as well as in the form of racemic or non-racemic mixtures thereof. The optical isomers can be obtained by resolution of the racemic mixtures according to conventional processes, e.g., by formation of diastereoisomeric salts, by treatment with an optically active acid or base. Examples of appropriate acids are tartaric, diacetyltartaric, dibenzoyltartaric,

ditoluoyltartaric, and camphorsulfonic acid and then separation of the mixture of diastereoisomers by crystallization followed by liberation of the optically active bases from these salts. A different process for separation of optical isomers involves the use of a chiral chromatography column optimally chosen to maximize the separation of the enantiomers. Still another available method involves synthesis of covalent diastereoisomeric molecules by reacting compounds of the invention with an optically pure acid in an activated form or an optically pure isocyanate. The synthesized diastereoisomers can be separated by conventional means such as chromatography, distillation, crystallization or sublimation, and then hydrolyzed to deliver the enantiomerically pure compound. The optically active compounds of the invention can likewise be obtained by using optically active starting materials. These isomers may be in the form of a free acid, a free base, an ester or a salt.

The compounds of this invention may contain one or more asymmetric centers and thus occur as racemates and racemic mixtures, scalemic mixtures, single enantiomers, individual diastereomers and diastereomeric mixtures. All such isomeric forms of these compounds are expressly included in the present invention.

The compounds of this invention may also be represented in multiple tautomeric forms, for example, as illustrated below:

The invention expressly includes all tautomeric forms of the compounds described herein.

The compounds may also occur in cis- or trans- or E- or Z- double bond isomeric forms. All such isomeric forms
5 of such compounds are expressly included in the present invention. All crystal forms of the compounds described herein are expressly included in the present invention.

Substituents on ring moieties (e.g., phenyl, thienyl, etc.) may be attached to specific atoms, whereby they are
10 intended to be fixed to that atom, or they may be drawn unattached to a specific atom, whereby they are intended to be attached at any available atom that is not already substituted by an atom other than H (hydrogen).

The compounds of this invention may contain
15 heterocyclic ring systems attached to another ring system. Such heterocyclic ring systems may be attached through a carbon atom or a heteroatom in the ring system.

Alternatively, a compound of any of the formulas delineated herein may be synthesized according to any of the
20 processes delineated herein. In the processes delineated herein, the steps may be performed in an alternate order and may be preceded, or followed, by additional protection/deprotection steps as necessary. The processes may further comprise use of appropriate reaction conditions,
25 including inert solvents, additional reagents, such as bases (e.g., LDA, DIEA, pyridine, K_2CO_3 , and the like), catalysts, and salt forms of the above. The intermediates may be isolated or carried on *in situ*, with or without purification. Purification methods are known in the art and
30 include, for example, crystallization, chromatography (liquid and gas phase, and the like), extraction, distillation, trituration, reverse phase HPLC and the like. Reactions conditions such as temperature, duration,

pressure, and atmosphere (inert gas, ambient) are known in the art and may be adjusted as appropriate for the reaction.

As can be appreciated by the skilled artisan, the above synthetic schemes are not intended to comprise a comprehensive list of all means by which the compounds described and claimed in this application may be synthesized. Further methods will be evident to those of ordinary skill in the art. Additionally, the various synthetic steps described above may be performed in an alternate sequence or order to give the desired compounds. Synthetic chemistry transformations and protecting group methodologies (protection and deprotection) useful in synthesizing the inhibitor compounds described herein are known in the art and include, for example, those such as described in R. Larock, *Comprehensive Organic Transformations*, VCH Publishers (1989); T.W. Greene and P.G.M. Wuts, *Protective Groups in Organic Synthesis*, 3rd. Ed., John Wiley and Sons (1999); L. Fieser and M. Fieser, *Fieser and Fieser's Reagents for Organic Synthesis*, John Wiley and Sons (1994); A. Katritzky and A. Pozharski, *Handbook of Heterocyclic Chemistry*, 2nd Ed. (2001); M. Bodanszky, *A. Bodanszky: The Practice of Peptide Synthesis* Springer-Verlag, Berlin Heidelberg (1984); J. Paquette, editor, *Encyclopedia of Reagents for Organic Synthesis*, John Wiley and Sons (1995).

The compounds of this invention may be modified by appending appropriate functionalities to enhance selective biological properties. Such modifications are known in the art and include those which increase biological penetration into a given biological compartment (e.g., blood, lymphatic system, central nervous system), increase oral availability, increase solubility to allow administration by injection,

alter metabolism and alter rate of excretion.

The following examples contain detailed descriptions of the methods of preparation of compounds of Formula I.

5 These detailed descriptions fall within the scope, and serve to exemplify, the above-described General Synthetic Procedures which form part of the invention. These detailed descriptions are presented for illustrative purposes only and are not intended as a restriction on the scope of the invention.

30 **Preparation I: 4-(3,4-Dinitrophenoxy)-pyridine.**

4-Chloropyridine (3.20 g, 28.2 mmol) and 3,4-dinitrophenol (5.96 g, 32.4 mmol) were combined in an open round-bottom flask fitted with running water condenser. The reaction flask was heated to 145 °C. After 45 min, 4N

HCl/dioxane (2.1 mL) was added. The reaction was heated for an additional 25 min then cooled to RT. The mix was dissolved in EtOAc and 0.5 N HCl/water. The aqueous layer was basified with 6 N NaOH. A beige solid was isolated and
5 identified as title compound.

4-(3,4-Dinitro-phenoxy)-pyridine (1.36 g, 5.21 mmol) was dissolved in 20 mL MeOH and 40 mL EtOAc. To the argon-
10 degassed solution was added 10% by weight Pd/C (0.35 g). The reaction was vigorously stirred for 42 h at RT under 1 atm of H₂ gas. The reaction was filtered through a Celite® plug. The solvent was removed under reduced pressure to obtain the title compound.

**Preparation IV: 1-(2-Chloro-5-nitro-benzyl)-4-methyl-
piperazine**

To RT solution of 2-chloro-5-nitrobenzaldehyde (3.28 g, 17.7 mmol) and 1-methylpiperazine (1.77 g, 17.7 mmol) in 60 mL CH₂Cl₂ was added NaBH(OAc)₃ (5.24 g, 24.7 mmol). The reaction was stirred overnight at RT. About 150 mL of 2 N NaOH was added and the reaction was stirred for at least 10 min. The reaction was diluted with CH₂Cl₂ and additional 2N NaOH. The layers were separated, and the CH₂Cl₂ layer was washed twice with 2 N NaOH. The aqueous layers were back-extracted once with CH₂Cl₂. The combined CH₂Cl₂ layers were extracted twice with 2 N HCl (total 150 mL), which was then basified to pH > 12 by treatment with solid NaOH. This latter aqueous layer was extracted twice with EtOAc. The EtOAc layers were washed once with a mix of brine and 2 N NaOH, combined, dried over Na₂SO₄, filtered, and concentrated *in vacuo*, to yield the title compound as an amber oil. MS (MH⁺) = NA; Calc'd 269.73 for C₁₂H₁₆ClN₃O₂.

The following intermediates were prepared similarly to the procedure outlined above for 1-2-chloro-5-nitrobenzyl-4-methylpiperazine.

Example 7

20

4-{2-[3-(2-Dimethylamino-ethyl)-4-methoxy-phenylamino]-1H-benzimidazol-5-yloxy}-pyridine-2-carboxylic acid methylamide

25

Step A: (2-Methoxy-5-nitrophenyl)-acetonitrile.

2-Bromomethyl-1-methoxy-4-nitro-benzene (25 g) was dissolved in warm EtOH (45 mL) and stirred while slowly

adding a solution of NaCN (6.0 g in 12 mL H₂O) at 70 °C. After the addition was complete, the reaction was stirred at 70 °C for 90 min. The inorganic solid, which separated on cooling, was collected and washed well with CH₃CN. The CH₃CN
5 filtrate was filtered again giving further inorganic solid, and again washed with CH₃CN. The final CH₃CN filtrate was evaporated giving a red-brown solid. This solid was triturated with CH₂Cl₂ until the washings were colorless. Evaporation of the CH₂Cl₂ filtrate gave (2-methoxy-5-
10 nitrophenyl)-acetonitrile as a red-brown solid, which was used without further purification.

Step B: 2-(2-Methoxy-5-nitrophenyl)acetic acid.

The crude (2-methoxy-5-nitrophenyl)-acetonitrile (Step
15 A) was stirred, heated with 20 mL of 12 M HCl at reflux for 3 h, then at 60 °C overnight. After cooling, the product was extracted in CH₂Cl₂ (3 x 40 mL), washed with H₂O then extracted into 3 M NaOH. The basic extracts were washed with CH₂Cl₂, acidified (6 M HCl) and the solid was
20 collected, washed well with water and dried in air giving pure 2-(2-methoxy-5-nitrophenyl)acetic acid. Evaporation of the CH₂Cl₂ extracts and retreating the residual solid with 50 mL of 12 M HCl/20 mL water at reflux for 6 h followed by purification as above gave additional pure 2-(2-methoxy-5-
25 nitrophenyl)acetic acid.

Step C: 2-(2-Methoxy-5-nitrophenyl)-N,N-dimethyl-acetamide.

2-(2-Methoxy-5-nitrophenyl)acetic acid (17.1 g, 1 eq, Step B), EDC (18.6 g, 1.2 eq.), Et₃N (9.8 g, 13.6 mL, 1.2
30 eq) and dimethylamine hydrochloride (7.9 g, 1.2 eq.) in 150 mL of CH₂Cl₂ were stirred together with exclusion of air overnight. CH₂Cl₂ (150 mL) was added and the mixture was washed twice with 1M HCl, twice with 1M NaOH, H₂O and brine. Removal of the solvent under reduced pressure followed by

silica gel chromatography (90:10 CH₂Cl₂:EtOAc) afforded pure 2-(2-methoxy-5-nitrophenyl)-N,N-dimethyl-acetamide as a white solid.

5 **Step D: [2-(2-Methoxy-5-nitrophenyl)-ethyl]-dimethyl-amine.**

2-(2-Methoxy-5-nitrophenyl)-N,N-dimethyl-acetamide (15.0 g, Step C) was added to 126 mL of 1M BH₃-THF (2 eq.) under N₂ and the resulting mixture was heated at reflux. After 2 h, additional BH₃-THF was added (120 mL) followed by
10 0.2 mL of boron trifluoride etherate and heating was continued for 13 h. Evaporation and azeotroping the residue from MeOH 3x gave a semi-solid residue which was washed with MeOH and filtered to give the boric acid salt of [2-(2-methoxy-5-nitrophenyl)-ethyl]-dimethyl-amine as a white
15 solid.

Step E: 3-(2-Dimethylamino-ethyl)-4-methoxy-phenylamine.

To a solution of [2-(2-methoxy-5-nitrophenyl)-ethyl]-dimethyl-amine (1.0 g, Step D) dissolved in EtOH (20 mL) was
20 added 10% Pd/C (0.1 g). The reaction vessel was capped with a rubber septum and H₂ gas was introduced through a balloon/needle. The reaction was stirred vigorously overnight at RT, and which time it was filtered through sand/Celite®. Concentration of the crude mixture provided a
25 beige oil which was purified by chromatography on silica gel (97:3 CH₂Cl₂:MeOH) to afford pure 3-(2-dimethylamino-ethyl)-4-methoxy-phenylamine as a white solid.

30 **Step F: 4-{2-[3-(2-Dimethylamino-ethyl)-4-methoxy-phenylamino]-1H-benzimidazol-5-yloxy}-pyridine-2-carboxylic acid methylester**

The title compound was prepared similarly to the procedure outlined above in Preparation III, Example 1. MS (MH⁺) = 461.1, MW: 460.21 Calc'd for: C₂₅H₂₈N₆O₃.

Anhydrous DMF (300 mL) was added and the mixture was stirred at 70 °C for 5 h. The mixture was cooled to RT and the solvent was removed. The obtained crude mixture was dissolved in CH₂Cl₂ (500 mL) and washed with 1 N NaOH (aq.). The organic layer was dried (MgSO₄), filtered and evaporated. The crude material was further purified by column chromatography (0-5% EtOAc in hexanes) providing pure 1-bromo-2-difluoromethoxy-4-nitro-benzene.

25 **Step B: 1-(2-Difluoromethoxy-4-nitro-phenyl)-4-isopropyl-piperazine.**

1-Bromo-2-difluoromethoxy-4-nitro-benzene (Step A, 2.0 g, 7.5 mmol, 1.0 eq.) and N-(2-propyl)piperazine (0.85 mL, 9.7 mmol, 1.3 eq.) were dissolved in 20 mL of DMSO. K₂CO₃

(1.5 g, 11.2 mmol, 1.5 eq.) and $\text{Bu}_4\text{N}^+\text{Br}^-$ (240 mg, 0.75 mmol, 0.1 eq.) were added and the mixture was heated to 120 °C. The mixture was stirred for 3 h and cooled to RT, poured into H_2O (200 mL) and 6 N HCl (20 mL). The aqueous solution
5 was washed with EtOAc, and alkalized with 6 N NaOH then extracted with EtOAc. The combined organic layers were dried (MgSO_4), filtered and concentrated. The crude material was further purified by column chromatography (0-100% EtOAc in hexanes) providing pure 1-(2-difluoromethoxy-4-nitro-phenyl)-4-isopropyl-piperazine.
10

Step C: 3-Difluoromethoxy-4-(4-isopropyl-piperazin-1-yl)-phenylamine.

1-(2-Difluoromethoxy-4-nitro-phenyl)-4-isopropyl-piperazine (Step B, 0.5 g, 1.9 mmol, 1.0 eq.) was dissolved
15 in MeOH (10 mL). The atmosphere was replaced by argon. A catalytic amount of 10% Pd/C was added and the argon was replaced by a H_2 atmosphere. The mixture was stirred for 16 h at RT at balloon pressure. The Pd/C was removed by
20 filtration and the solvent was removed under vacuum to yield 3-difluoromethoxy-4-(4-isopropyl-piperazin-1-yl)-phenylamine. The crude material was used as is in the next step.

25 **Step D: 4-{2-[3-Difluoromethoxy-4-(4-isopropyl-piperazin-1-yl)-phenylamino]-1H-benzimidazol-5-yloxy}-pyridine-2-carboxylic acid methylamide.**

Step A: 1H-Pyrrolo[2,3-b]pyridine 7-oxide

To a suspension of 1H-pyrrolo[2,3-b]pyridine (20.0 g) and NaHCO₃ (90 g) in 1:1 MeOH/H₂O (1000 mL) was added Oxone® (212 g) in portions during a 40 min period. The mixture was stirred at RT for 5 h. The solid was removed by filtration and the filtrate was concentrated to dryness. The solid residue was washed several times with CH₂Cl₂/MeOH 90/10 (500 mL). The combined organic solutions were concentrated under vacuum. The resulting crystalline solid was dissolved in CH₂Cl₂ (1 L). The organic solution was dried over MgSO₄ and the solvent was removed under vacuum. The crude material was purified on Silica gel using a CH₂Cl₂/EtOAc gradient (100/0 to 0/100) to afford 1H-pyrrolo[2,3-b]pyridine 7-oxide.

Step B: 4-Chloro-1H-pyrrolo[2,3-b]pyridine

To cooled POCl₃ (50 mL) in a dried round bottom flask, 1H-pyrrolo[2,3-b]pyridine 7-oxide (6.6 g, step A) was added in portions. The mixture was heated to reflux for 5 h. After cooling to RT, POCl₃ was evaporated under high vacuum with gentle heating (40-50 °C) to obtain a black residue. Water (50 mL) was added slowly and the pH was adjusted to 8-9 with Na₂CO₃ (first with solid, then saturated aqueous solution). The resulting precipitate was collected by filtration, washed with cold H₂O and dried in a vacuum oven (50 °C) to give 4-chloro-1H-pyrrolo[2,3-b]pyridine as a tan powder. This was a mixture of desired product and a regioisomer, which was used in the next step without further purification.

5 **[4-Chloro-3-(4-methylpiperazin-1-ylmethyl)-phenyl]-[5-(6,7-dimethoxyquinolin-4-yloxy)-1H-benzimidazol-2-yl]-amine**

Step A: 4-(3,4-Dinitrophenoxy)-6,7-dimethoxyquinoline

 A mixture of 6,7-dimethoxy-4-chloroquinoline (0.35 g,
10 1.6 mmol) and 3,4-dinitrophenol (0.85 g, 4.6 mmol) was
heated to 150 °C for 4 h. The mixture was cooled at RT and
MeOH added. The reaction was stirred for 3 h. The

BIOLOGICAL EVALUATION

HUVEC Proliferation Assay

Human Umbilical Vein Endothelial cells are purchased from Clonetics, Inc., as cryopreserved cells harvested from
25 a pool of donors. These cells, at passage 1, are thawed and expanded in EBM-2 complete medium, until passage 2 or 3. The cells are trypsinized, washed in DMEM + 10% FBS + antibiotics, and spun at 1000 rpm for 10 min. Prior to centrifugation of the cells, a small amount is collected for
30 a cell count. After centrifugation, the medium is discarded, and the cells are resuspended in the appropriate volume of DMEM + 10% FBS + antibiotics to achieve a concentration of 3x10⁵ cells/mL. Another cell count is

performed to confirm the cell concentration. The cells are diluted to 3×10^4 cells/mL in DMEM + 10% FBS + antibiotics, and 100 μ L of cells are added to a 96-well plate. The cells
5 are incubated at 37 °C for 22 h.

Prior to the completion of the incubation period, compound dilutions are prepared. Five-point, five-fold serial dilutions are prepared in DMSO, at concentrations 400-fold greater than the final concentrations desired. 2.5
10 μ L of each compound dilution are diluted further in a total of 1 mL DMEM + 10% FBS + antibiotics (400x dilution). Medium containing 0.25% DMSO is also prepared for the 0 μ M compound sample. After 22-h, the medium is removed from the cells, and 100 μ L of each compound dilution is added. The
15 cells are incubated at 37 °C for 2-3 h.

During the compound pre-incubation period, the growth factors are diluted to the appropriate concentrations. Solutions of DMEM + 10% FBS + antibiotics, containing either VEGF or bFGF at the following concentrations: 50, 10, 2,
20 0.4, 0.08, and 0 ng/mL are prepared. For the compound-treated cells, solutions of VEGF at 550 ng/mL or bFGF at 220 ng/mL for 50 ng/mL or 20 ng/mL final concentrations, respectively, are prepared since 10 μ L of each will be added to the cells (110 μ L final volume). At the appropriate time
25 after adding the compounds, the growth factors are added. VEGF is added to one set of plates, while bFGF is added to another set of plates. For the growth factor control curves, the media on wells B4-G6 of plates 1 and 2 are replaced with media containing VEGF or bFGF at the varying
30 concentrations (50 - 0 ng/mL). The cells are incubated at 37 °C for an additional 72 h.

At the completion of the 72 h incubation period, the medium is removed, and the cells are washed twice with PBS. After the second wash with PBS, the plates are tapped gently

to remove excess PBS, and the cells are placed at -70°C for at least 30 min. The cells are thawed and analyzed using the CyQuant fluorescent dye (Molecular Probes C-7026), following the manufacturer's recommendations. The plates
5 are read on a Victor/Wallac 1420 workstation at 485 nm/530 nm (excitation/emission). Raw data are collected and analyzed using a 4-parameter fit equation in XLFit. IC₅₀ values are then determined.

Examples 6, 13a, 13c, 17, 28-29, 32, 36, 38-39, 45-47,
10 49, 236-237, 238-240, 242-249, 252, 257, 259 and 263-265 inhibited VEGF-stimulated HUVEC proliferation at a level below 100 nm.

Angiogenesis Model

15

To determine the effects of the present compounds on angiogenesis *in vivo*, selective compounds are tested in the rat corneal neovascularization micropocket model or the angiogenesis assay of Passaniti, Lab. Invest., 67:519-528
20 (1992).

Rat Corneal Neovascularization Micropocket Model

In Life Aspects: Female Sprague Dawley rats weighing
25 approximately 250 g are randomized into one of five treatment groups. Pretreatment with the vehicle or compound is administered orally, 24 h prior to surgery and continued once a day for seven additional days. On the day of surgery, the rats are temporarily anesthetized in an
30 Isofluorane gas chamber (delivering 2.5 L/min oxygen + 5% Isofluorane). An othoscope is then placed inside the mouth of the animal to visualize the vocal cords. A tip-blunted wire is advanced in between the vocal cords and used as a guide for the placement of an endotracheal Teflon tube
35 (Small Parts Inc. TFE-standard Wall R-SWTT-18). A volume-

controlled ventilator (Harvard Apparatus, Inc. Model 683) is connected to the endotracheal tube to deliver a mixture of oxygen and 3% Isoflurane. Upon achieving deep anesthesia, the whiskers are cut short and the eye areas and eyes gently
5 ished with Betadine soap and rinsed with sterile saline. The corneas are irrigated with one to two drops of Proparacaine HCl ophthalmic topical anesthetic solution (0.5%) (Bausch and Lomb Pharmaceuticals, Tampa FL). The rat is then positioned under the dissecting microscope and the
10 corneal surface brought into focus. A vertical incision is made on the midline of the cornea using a diamond blade knife. A pocket is created by using fine scissors to separate the connective tissue layers of the stroma, tunneling towards the limbus of the eye. The distance
15 between the apex of the pocket and the limbus is approximately 1.5 mm. After the pocket had been made, the soaked nitrocellulose disk filter (Gelman Sciences, Ann Arbor MI.) is inserted under the lip of the pocket. This surgical procedure is performed on both eyes. rHu-bFGF
20 soaked disks are placed into the right eye, and the rHu-VEGF soaked disks are placed into the left eye. Vehicle soaked disks are placed in both eyes. The disk is pushed into position at the desired distance from the limbal vessels. Ophthalmic antibiotic ointment is applied to the eye to
25 prevent drying and infection. After 7 days, the rats are euthanized by CO₂ asphyxiation, and the eyes enucleated. The retinal hemisphere of the eye is windowed to facilitate fixation, and the eye placed into formalin overnight.

Post Mortem Aspects: After 24 h in fixative, the
30 corneal region of interest is dissected out from the eye, using fine forceps and a razorblade. The retinal hemisphere is trimmed off and the lens extracted and discarded. The corneal dome is bisected and the superfluous cornea trimmed off. The iris, conjunctiva and associated limbal glands are

then carefully teased away. Final cuts are made to generate a square 3x3mm containing the disk, the limbus, and the entire zone of neovascularization.

Gross Image Recording: The corneal specimens are
5 digitally photographed using a Sony CatsEye DKC5000 camera (A.G. Heinz, Irvine CA) mounted on a Nikon SMZ-U stereo microscope (A.G. Heinz). The corneas are submerged in distilled water and photographed via trans-illumination at approximately 5.0 diameters magnification.

10 **Image analysis:** Numerical endpoints are generated using digital micrographs collected from the whole mount corneas after trimming and are used for image analysis on the Metamorph image analysis system (Universal Imaging Corporation, West Chester PA). Three measurements are taken:
15 Disk placement distance from the limbus, number of vessels intersecting a 2.0mm perpendicular line at the midpoint of the disk placement distance, and percent blood vessel area of the diffusion determined by thresholding.

General Formulations:

20 **0.1% BSA in PBS vehicle:** 0.025 g of BSA is added to 25.0 mL of sterile 1X phosphate buffered saline, gently shaken until fully dissolved, and filtered at 0.2 μ m. Individual 1.0 mL samples are aliquoted into 25 single use vials, and stored at -20 °C until use. For the rHu-bFGF disks, a vial of this
25 0.1% BSA solution is thawed at RT. Once thawed, 10 μ L of a 100 mM stock solution of DTT is added to the 1 mL BSA vial to yield a final concentration of 1 mM DTT in 0.1% BSA.

rHu-VEGF Dilutions:

Prior to the disk implant surgery, 23.8 μ L of the 0.1% BSA
30 vehicle above is added to a 10 μ g rHu-VEGF lyophilized vial yielding a final concentration of 10 μ M.

rHu-bFGF: Stock concentration of 180 ng/ μ L:

R&D rHu- bFGF: Added 139 μ l of the appropriate vehicle above is added to the 25 μ g vial lyophilized vial. 13.3 μ L of the

[180 ng/ μ l] stock vial and added 26.6 μ L of vehicle to yield a final concentration of 3.75 μ M concentration.

Nitro-cellulose disk preparation: The tip of a 20-gauge needle is cut off square and beveled with emery paper to
5 create a punch. This tip is then used to cut out \approx 0.5mm diameter disks from a nitrocellulose filter paper sheet (Gelman Sciences). Prepared disks are then placed into Eppendorf microfuge tubes containing solutions of either
10 0.1% BSA in PBS vehicle, 10 μ M rHu-VEGF (R&D Systems, Minneapolis, MN), or 3.75 μ M rHu-bFGF (R&D Systems, Minneapolis, MN) and allowed to soak for 45-60 min before use. Each nitrocellulose filter disk absorbs approximately 0.1 μ l of solution.

In the rat micropocket assay, compounds of the present
15 invention will inhibit angiogenesis at a dose of less than 50 mg/kg/day.

Tumor model

A431 cells (ATCC) are expanded in culture, harvested
20 and injected subcutaneously into 5-8 week old female nude mice (CD1 nu/nu, Charles River Labs) (n=5-15). Subsequent administration of compound by oral gavage (10 - 200 mpk/dose) begins anywhere from day 0 to day 29 post tumor cell challenge and generally continues either once or twice
25 a day for the duration of the experiment. Progression of tumor growth is followed by three dimensional caliper measurements and recorded as a function of time. Initial statistical analysis is done by repeated measures analysis of variance (RMANOVA), followed by Scheffe post hoc testing
30 for multiple comparisons. Vehicle alone (Ora-Plus, pH 2.0) is the negative control. Compounds of the present invention are active at doses less than 150 mpk.

Rat Adjuvant Arthritis Model:

The rat adjuvant arthritis model (Pearson, Proc. Soc. Exp. Biol. 91:95-101 (1956)) is used to test the anti-
5 arthritic activity of compounds of the Formula I, or salts thereof. Adjuvant Arthritis can be treated using two different dosing schedules: either (i) starting time of immunization with adjuvant (prophylactic dosing); or from
10 day 15 when the arthritic response is already established (therapeutic dosing). Preferably a therapeutic dosing schedule is used.

Rat Carrageenan-induced Analgesia Test

15 The rat carrageenan analgesia test is performed with materials, reagents and procedures essentially as described by Hargreaves, et al., (Pain, 32:77 (1988)). Male Sprague-Dawley rats are treated as previously described for the Carrageenan Foot Pad Edema test. Three hours after the
20 injection of the carrageenan, the rats are placed in a special plexiglass container with a transparent floor having a high intensity lamp as a radiant heat source, positionable under the floor. After an initial twenty minute period, thermal stimulation is begun on either the injected foot or
25 on the contralateral uninjected foot. A photoelectric cell turned off the lamp and timer when light is interrupted by paw withdrawal. The time until the rat withdraws its foot is then measured. The withdrawal latency in seconds is determined for the control and drug-treated groups, and
30 percent inhibition of the hyperalgesic foot withdrawal determined.

Formulations

Also embraced within this invention is a class of pharmaceutical compositions comprising the active compounds of Formula I in association with one or more non-toxic, pharmaceutically-acceptable carriers and/or diluents and/or adjuvants (collectively referred to herein as "carrier" materials) and, if desired, other active ingredients. The active compounds of the present invention may be administered by any suitable route, preferably in the form of a pharmaceutical composition adapted to such a route, and in a dose effective for the treatment intended. The compounds and compositions of the present invention may, for example, be administered orally, mucosally, topically, rectally, pulmonarily such as by inhalation spray, or parentally including intravascularly, intravenously, intraperitoneally, subcutaneously, intramuscularly intrasternally and infusion techniques, in dosage unit formulations containing conventional pharmaceutically acceptable carriers, adjuvants, and vehicles.

The pharmaceutically active compounds of this invention can be processed in accordance with conventional methods of pharmacy to produce medicinal agents for administration to patients, including humans and other mammals.

For oral administration, the pharmaceutical composition may be in the form of, for example, a tablet, capsule, suspension or liquid. The pharmaceutical composition is preferably made in the form of a dosage unit containing a particular amount of the active ingredient. Examples of such dosage units are tablets or capsules. For example, these may contain an amount of active ingredient from about 1 to 2000 mg, preferably from about 1 to 500 mg. A suitable daily dose for a human or other mammal may vary widely depending on the condition of the patient and other

factors, but, once again, can be determined using routine methods.

The amount of compounds which are administered and the dosage regimen for treating a disease condition with the compounds and/or compositions of this invention depends on a variety of factors, including the age, weight, sex and medical condition of the subject, the type of disease, the severity of the disease, the route and frequency of administration, and the particular compound employed. Thus, the dosage regimen may vary widely, but can be determined routinely using standard methods. A daily dose of about 0.01 to 500 mg/kg, preferably between about 0.1 and about 50 mg/kg, and more preferably about 0.1 and about 20 mg/kg body weight may be appropriate. The daily dose can be administered in one to four doses per day.

For therapeutic purposes, the active compounds of this invention are ordinarily combined with one or more adjuvants appropriate to the indicated route of administration. If administered per os, the compounds may be admixed with lactose, sucrose, starch powder, cellulose esters of alkanolic acids, cellulose alkyl esters, talc, stearic acid, magnesium stearate, magnesium oxide, sodium and calcium salts of phosphoric and sulfuric acids, gelatin, acacia gum, sodium alginate, polyvinylpyrrolidone, and/or polyvinyl alcohol, and then tableted or encapsulated for convenient administration. Such capsules or tablets may contain a controlled-release formulation as may be provided in a dispersion of active compound in hydroxypropylmethyl cellulose.

In the case of psoriasis and other skin conditions, it may be preferable to apply a topical preparation of compounds of this invention to the affected area two to four times a day.

Formulations suitable for topical administration include liquid or semi-liquid preparations suitable for penetration through the skin (e.g., liniments, lotions, ointments, creams, or pastes) and drops suitable for administration to the eye, ear, or nose. A suitable topical dose of active ingredient of a compound of the invention is 0.1 mg to 150 mg administered one to four, preferably one or two times daily. For topical administration, the active ingredient may comprise from 0.001% to 10% w/w, e.g., from 1% to 2% by weight of the formulation, although it may comprise as much as 10% w/w, but preferably not more than 5% w/w, and more preferably from 0.1% to 1% of the formulation.

When formulated in an ointment, the active ingredients may be employed with either paraffinic or a water-miscible ointment base. Alternatively, the active ingredients may be formulated in a cream with an oil-in-water cream base. If desired, the aqueous phase of the cream base may include, for example at least 30% w/w of a polyhydric alcohol such as propylene glycol, butane-1,3-diol, mannitol, sorbitol, glycerol, polyethylene glycol and mixtures thereof. The topical formulation may desirably include a compound which enhances absorption or penetration of the active ingredient through the skin or other affected areas. Examples of such dermal penetration enhancers include dimethylsulfoxide and related analogs.

The compounds of this invention can also be administered by a transdermal device. Preferably transdermal administration will be accomplished using a patch either of the reservoir and porous membrane type or of a solid matrix variety. In either case, the active agent is delivered continuously from the reservoir or microcapsules through a membrane into the active agent permeable adhesive, which is in contact with the skin or mucosa of the recipient. If the

active agent is absorbed through the skin, a controlled and predetermined flow of the active agent is administered to the recipient. In the case of microcapsules, the encapsulating agent may also function as the membrane.

5 The oily phase of the emulsions of this invention may be constituted from known ingredients in a known manner. While the phase may comprise merely an emulsifier, it may comprise a mixture of at least one emulsifier with a fat or an oil or with both a fat and an oil. Preferably, a
10 hydrophilic emulsifier is included together with a lipophilic emulsifier which acts as a stabilizer. It is also preferred to include both an oil and a fat. Together, the emulsifier(s) with or without stabilizer(s) make-up the so-called emulsifying wax, and the wax together with the
15 oil and fat make up the so-called emulsifying ointment base which forms the oily dispersed phase of the cream formulations. Emulsifiers and emulsion stabilizers suitable for use in the formulation of the present invention include Tween 60, Span 80, cetostearyl alcohol, myristyl alcohol,
20 glyceryl monostearate, sodium lauryl sulfate, glyceryl distearate alone or with a wax, or other materials well known in the art.

 The choice of suitable oils or fats for the formulation is based on achieving the desired cosmetic
25 properties, since the solubility of the active compound in most oils likely to be used in pharmaceutical emulsion formulations is very low. Thus, the cream should preferably be a non-greasy, non-staining and washable product with suitable consistency to avoid leakage from tubes or other
30 containers. Straight or branched chain, mono- or dibasic alkyl esters such as di-isoadipate, isocetyl stearate, propylene glycol diester of coconut fatty acids, isopropyl myristate, decyl oleate, isopropyl palmitate, butyl stearate, 2-ethylhexyl palmitate or a blend of branched

chain esters may be used. These may be used alone or in combination depending on the properties required. Alternatively, high melting point lipids such as white soft paraffin and/or liquid paraffin or other mineral oils can be used.

Formulations suitable for topical administration to the eye also include eye drops wherein the active ingredients are dissolved or suspended in suitable carrier, especially an aqueous solvent for the active ingredients.

10 The active ingredients are preferably present in such formulations in a concentration of 0.5 to 20%, advantageously 0.5 to 10% and particularly about 1.5% w/w.

Formulations for parenteral administration may be in the form of aqueous or non-aqueous isotonic sterile injection solutions or suspensions. These solutions and suspensions may be prepared from sterile powders or granules using one or more of the carriers or diluents mentioned for use in the formulations for oral administration or by using other suitable dispersing or wetting agents and suspending agents. The compounds may be dissolved in water, polyethylene glycol, propylene glycol, ethanol, corn oil, cottonseed oil, peanut oil, sesame oil, benzyl alcohol, sodium chloride, tragacanth gum, and/or various buffers. Other adjuvants and modes of administration are well and widely known in the pharmaceutical art. The active ingredient may also be administered by injection as a composition with suitable carriers including saline, dextrose, or water, or with cyclodextrin (ie. Captisol), cosolvent solubilization (ie. propylene glycol) or micellar solubilization (ie. Tween 80).

The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, for example as a solution in 1,3-butanediol. Among the acceptable vehicles

and solvents that may be employed are water, Ringer's solution, and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland
5 fixed oil may be employed, including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

For pulmonary administration, the pharmaceutical composition may be administered in the form of an aerosol or
10 with an inhaler including dry powder aerosol.

Suppositories for rectal administration of the drug can be prepared by mixing the drug with a suitable non-irritating excipient such as cocoa butter and polyethylene glycols that are solid at ordinary temperatures but liquid
15 at the rectal temperature and will therefore melt in the rectum and release the drug.

The pharmaceutical compositions may be subjected to conventional pharmaceutical operations such as sterilization and/or may contain conventional adjuvants,
20 such as preservatives, stabilizers, wetting agents, emulsifiers, buffers etc. Tablets and pills can additionally be prepared with enteric coatings. Such compositions may also comprise adjuvants, such as wetting, sweetening, flavoring, and perfuming agents.

25 The foregoing is merely illustrative of the invention and is not intended to limit the invention to the disclosed compounds. Variations and changes which are obvious to one skilled in the art are intended to be within the scope and nature of the invention which are defined in the appended
30 claims.

From the foregoing description, one skilled in the art can easily ascertain the essential characteristics of this invention, and without departing from the spirit and scope

thereof, can make various changes and modifications of the invention to adapt it to various usages and conditions.

All mentioned references, patents, applications and publications, are hereby incorporated by reference in their
5 entirety, as if here written.
